

# Adverse Environmental and Off-Site Human Health Effects from Airborne Emissions Emitted from Concentrated Animal Feeding Operations

Presented at the Iowa Center for Agricultural Health and Safety (ICASH) Annual Meeting, Des Moines, IA November 09, 2001

James A. Zahn, *Ph.D*

*United States Department of Agriculture-Agricultural Research Service*

*National Swine Research & Information Center*

*2150 Pammel Drive, Ames, IA 50011 USA*

*Zahn@nsric.ars.usda.gov*

# Air Pollutants Emitted from Concentrated Animal Feeding Operations

- Non-organic nitrogen-containing compounds:
  - ◆ Ammonia ( $\text{NH}_3$ )\*
  - ◆ Dinitrogen ( $\text{N}_2$ )
  - ◆ Nitrous oxide ( $\text{N}_2\text{O}$ )
- Hydrogen sulfide ( $\text{H}_2\text{S}$ )\*
- Carbon dioxide ( $\text{CO}_2$ )
- Methane ( $\text{CH}_4$ )
- Non-methane organic compounds (certain VOC\*)
  - ◆ Volatile organic compounds (VOC; generally vapor pres.  $\geq 0.1$  mm Hg )
  - ◆ Non-volatile organic compounds (vapor pres.  $< 0.003$  mm Hg;  $> 140$  amu)
- Particulate matter\*
  - ◆ Bioaerosols/bioactive compounds (fungi, bacteria, LPS, bioactive secondary metabolites, ect...).

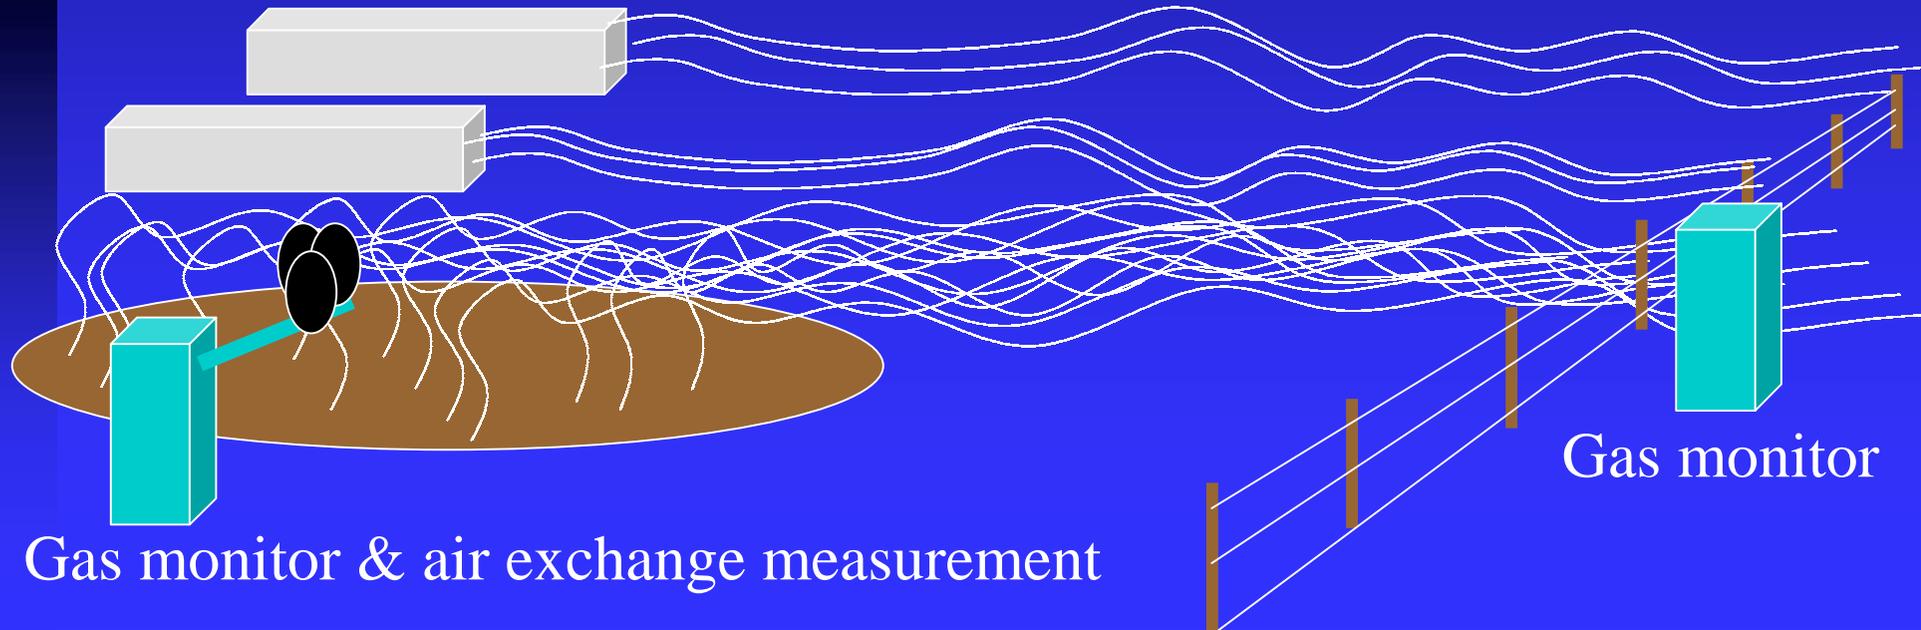

\* = regulated air pollutants

# Regulation of Emissions from CAFOs:

## *Measuring Gas Releases from a Point Source*

- Concentration of compound in air ( $\mu\text{g H}_2\text{S}$  per  $\text{m}^3$  of air).
  - Advantages: true health-related measure, inexpensive, simple.
  - Disadvantages: concentration is dependent upon wind direction, wind speed, distance, and strength of source (solution to pollution is dilution).
- Emission rate: ( $\mu\text{g H}_2\text{S}$  per  $\text{m}^2$  surface area per second).
  - Advantages: total amount of compound released from point source over time. Independent of environmental conditions and post-source dilution.
  - Requires air flow/air exchange rate and expensive equipment-labor.

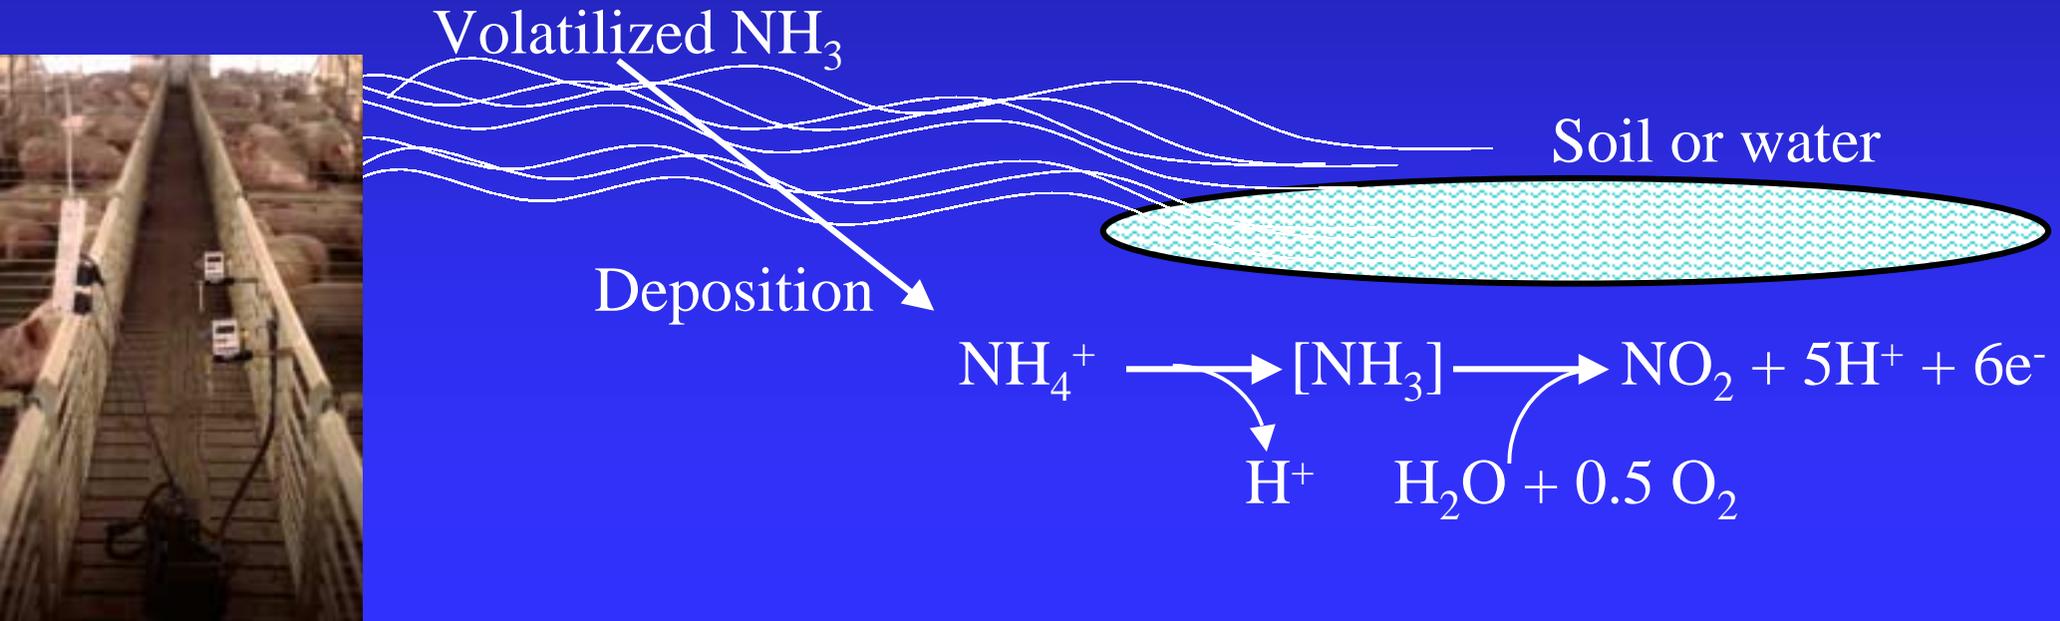

# Air Quality Regulations In Agriculture

- Nuisance: (used in 10 States; no measurable standard for calibration)
  - ◆ Colorado: Sentometer 7:1 at property boundary
  - ◆ Missouri: Sentometer 5.4:1 at property boundary
    - ◆ A Dead End? Enforcement problems: a) human olfactory measurement, b) grab sampling.
  - ◆ Minnesota & California (mean olfactory perception level = 30 ppb)
    - ◆ H<sub>2</sub>S 70µg\*m<sup>-3</sup> (70ppb) 0.5 hr ave; ≤ 2 occurrences \* year<sup>-1</sup>
    - ◆ H<sub>2</sub>S 42µg\*m<sup>-3</sup> (30ppb) 0.5 hr ave; ≤ 2 occurrences\* 5 day period<sup>-1</sup>
- Human Health / Environmental Quality:
  - ◆ At the point source:
    - ◆ Occupational exposure standards (i.e. H<sub>2</sub>S TWA; 15,000 µg\*m<sup>-3</sup>)
    - ◆ Superfund; Comprehensive Environmental Response Compensation and Liability Act (CERCLA), 40 CFR Part 302; (NH<sub>3</sub>, H<sub>2</sub>S, VOC, PM) 100 lbs\*day<sup>-1</sup> from point source.  
-- Basis of recent (2000-2002) EPA lawsuits against Premium Standard Farms --
  - ◆ Down wind from the point source:
    - ◆ Acute health risk values. Below-Lowest Observed Adverse Effect Level (LOAEL) intended to protect sensitive subgroups located near point source.

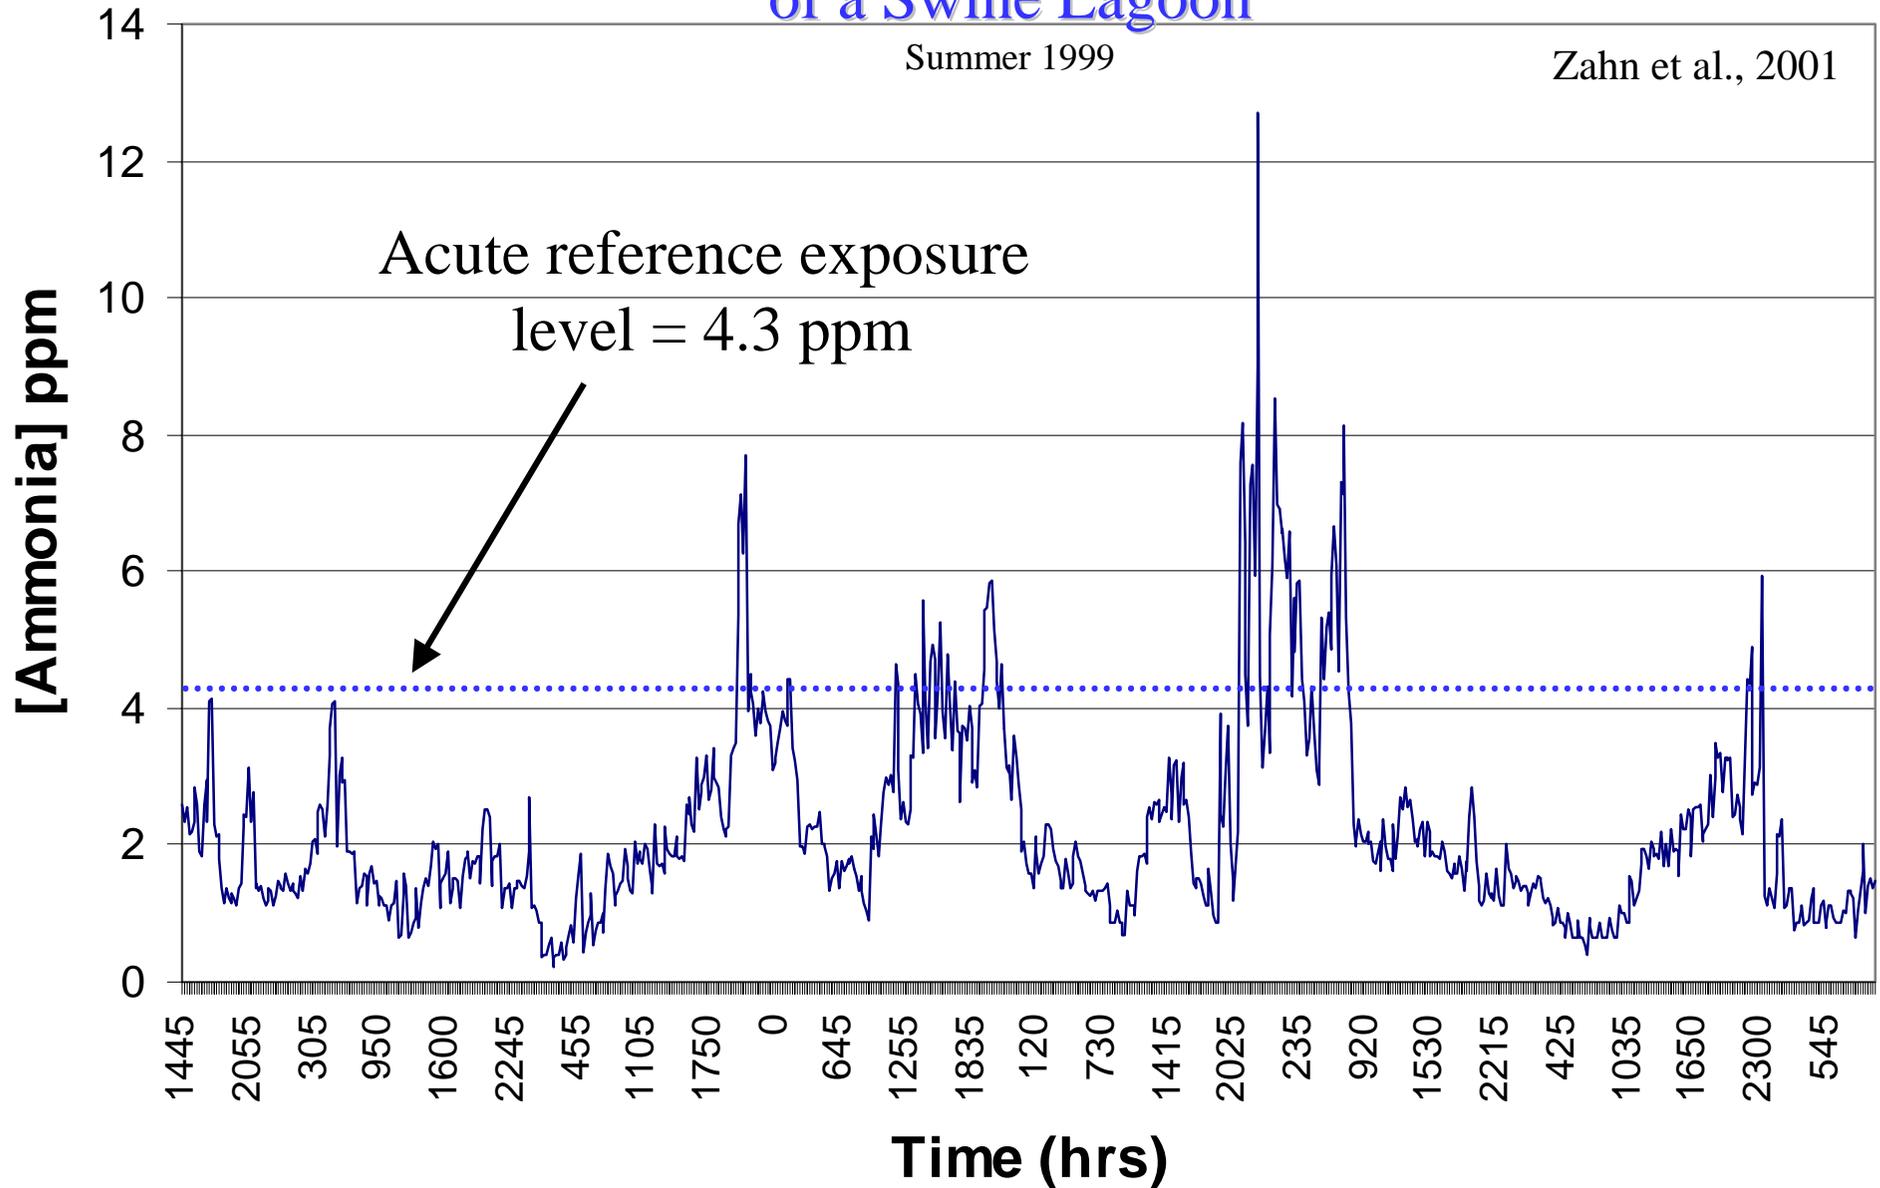

# Impact of CAFO Emissions on the Environment and Human Health

## ■ Ammonia (NH<sub>3</sub>):

- ◆ U.S. EPA hazardous substance (recent CERCLA waiver).
- ◆ Acute reference exposure level (1 hr) 3.2 mg\*m<sup>-3</sup> or 4.3 ppm.
- ◆ Deposition associated with decreased water quality and acidification.
- ◆ European “target” air pollutant: <157 kton yr<sup>-1</sup> (70% reduction standard) by the year 2005. Agriculture considered to produce >80% of total atmospheric NH<sub>3</sub>.

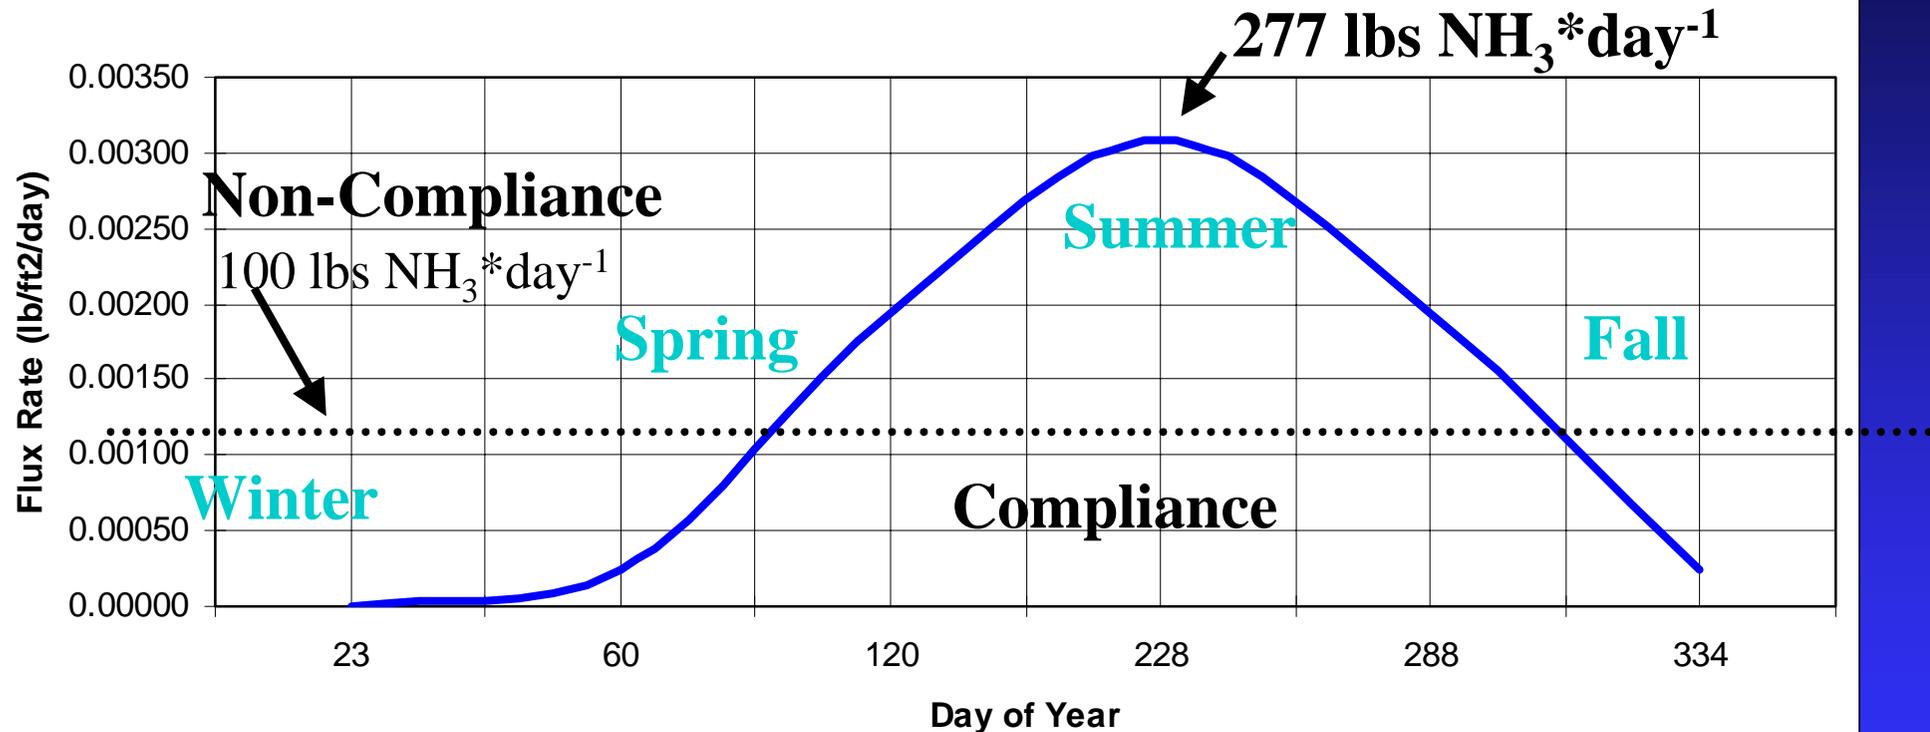

# Concentration of Ammonia in Air Sampled on the Berm of a Swine Lagoon

# Evidence for CERCLA Non-Compliant Swine Lagoon

Seasonal Ammonia Flux From a 1.99 Acre Swine Lagoon: 1999-2000

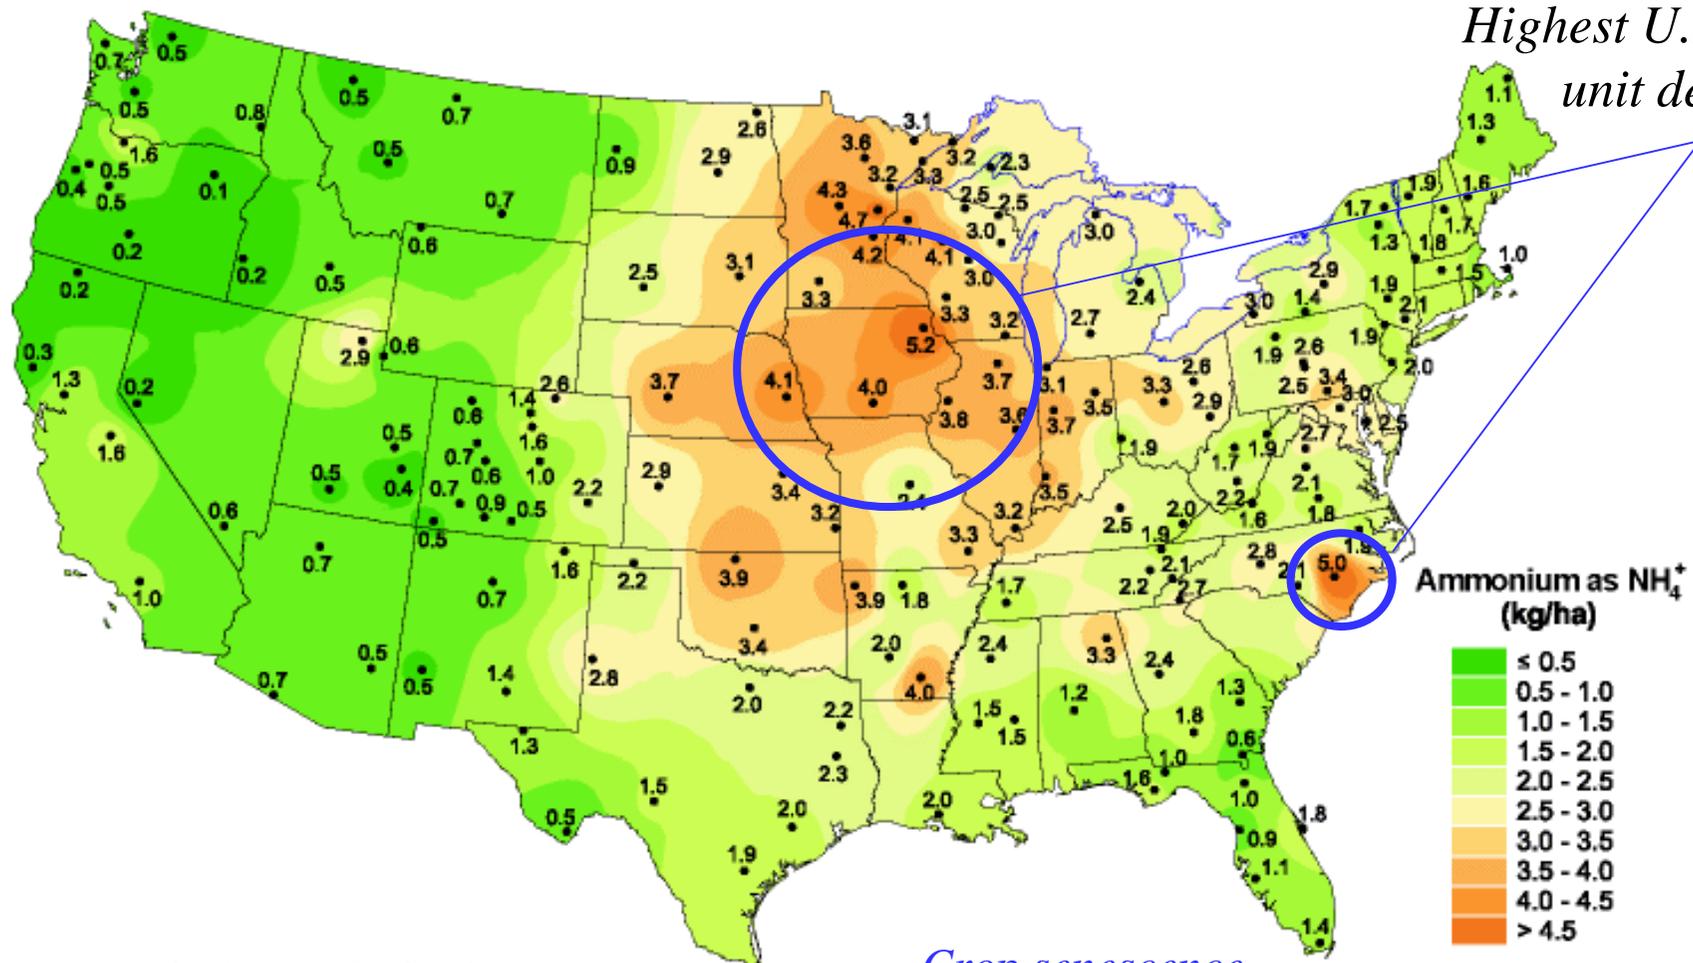

Zahn et al., 2001, 51:174-185, JAWMA

In perspective: 157,000 U.S. swine production facilities produce 103,000,000 hogs yr<sup>-1</sup>  
157,000 facilities x 277 lbs\*day<sup>-1</sup> = 43,489,000 lbs NH<sub>3</sub>\*day<sup>-1</sup> from U.S. swine production

# CAFO Density as a Major Contributor to Atmospheric Ammonia Deposition

## Estimated ammonium ion deposition, 1999

*Crop senescence*  
*CAFO emission*  
*Nitrogen fertilization*

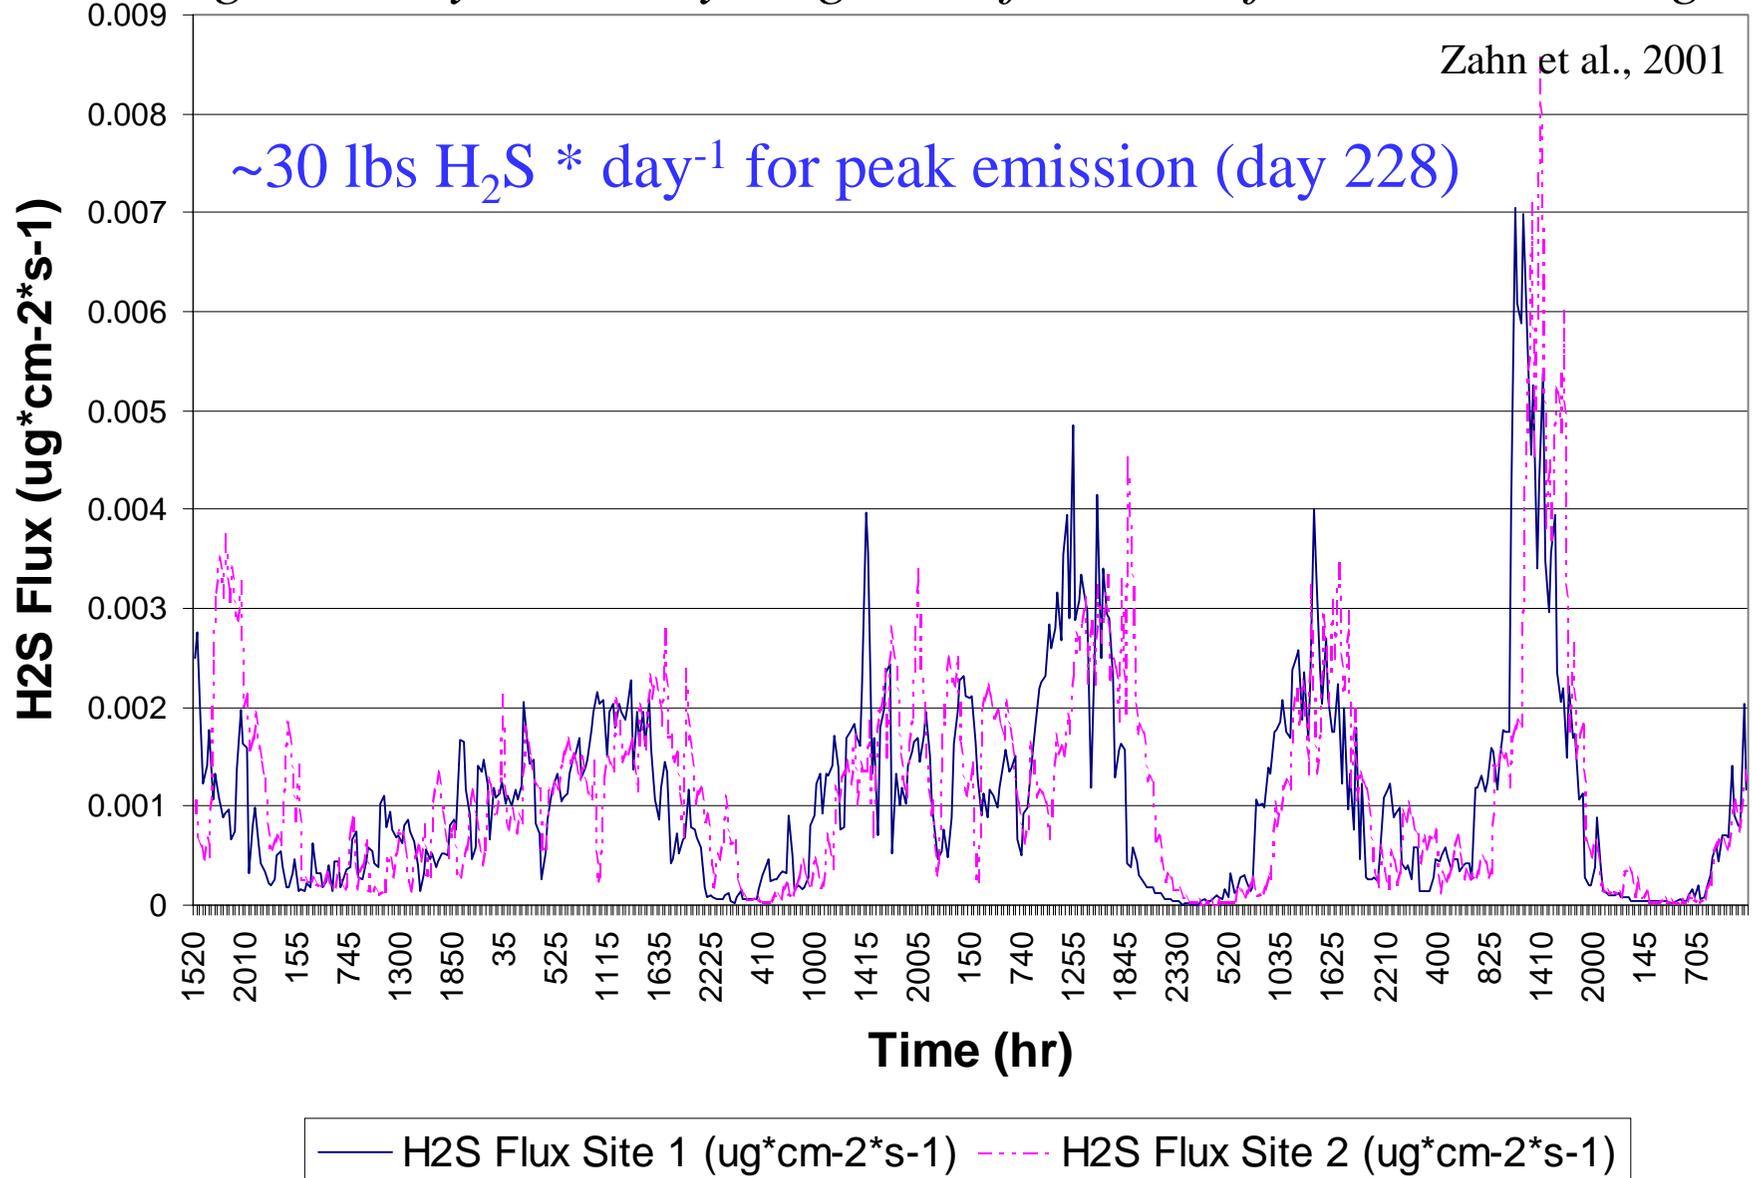

Lawrence, et al., Atmospheric nitrogen  
in the Mississippi River Basin – Emissions deposition  
And Transport, Science to the Total  
Environment, **248**: 87-99

# Impact of CAFO Emissions on the Environment and Human Health

## ■ Hydrogen sulfide (H<sub>2</sub>S):

- ◆ Major weakly acidic gas emitted from CAFOs.
- ◆ Ambient air quality standard to limit odor nuisance.
  - Only certain states (MN, CA)
  - Mean olfactory perception 30 ppb (42  $\mu\text{g}\cdot\text{m}^{-3}$ ).
  - Easy and relatively inexpensive to measure.
- ◆ Linked to neurobehavioral dysfunction (oil refinery sites).
  - Endogenous neuromodulator in hippocampus (Kilburn & Warshaw, 1995).
- ◆ Acute health risk value (HRV):
  - U.S. EPA not considered criteria or hazardous air pollutant
  - MN 60 ppb or 80  $\mu\text{g}\cdot\text{m}^{-3}$  acute HRV
  - CA 30 ppb or 42  $\mu\text{g}\cdot\text{m}^{-3}$  for acute reference exposure level (REL)
  - CA 08 ppb or 10  $\mu\text{g}\cdot\text{m}^{-3}$  for chronic REL (nasal histological changes).

# 17 through 24 July, 1999 Hydrogen Sulfide Flux from a Swine Lagoon

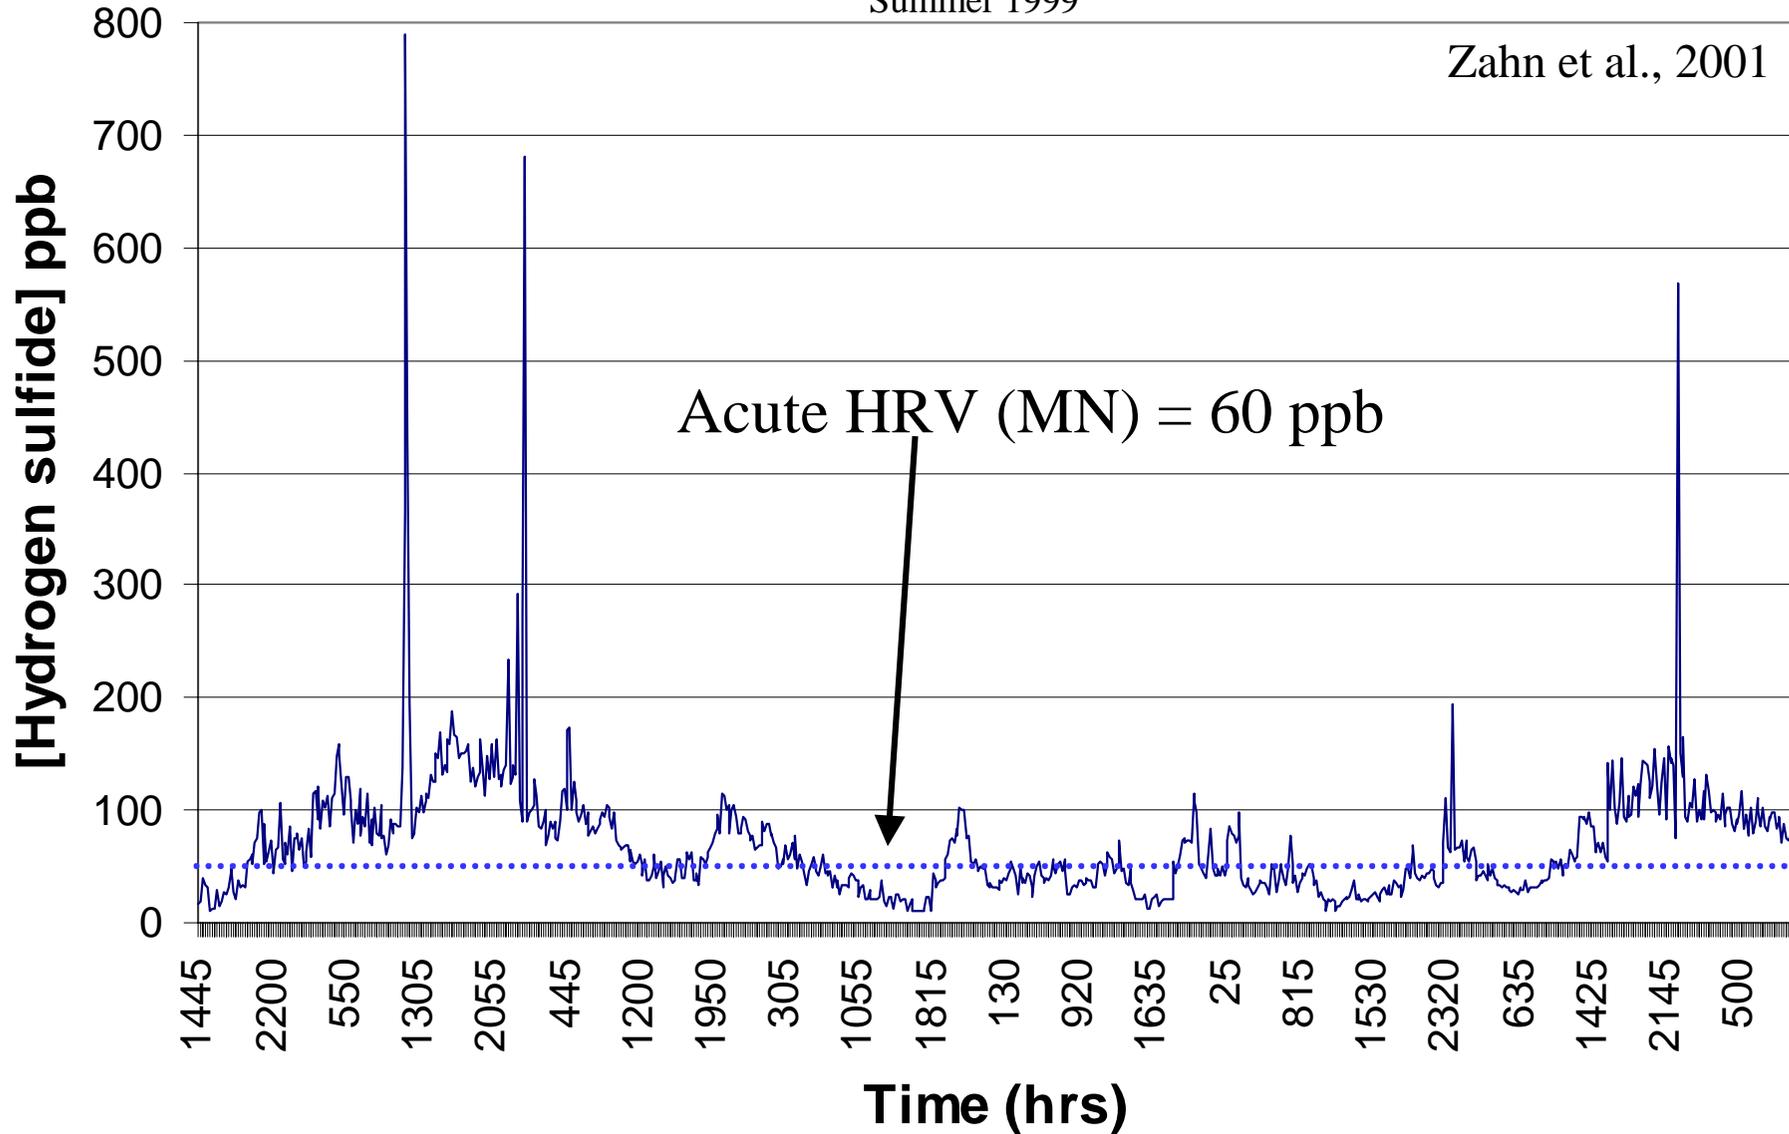

Iowa: 40,000 facilities x 30 lbs per day = 1,200,000 lbs H<sub>2</sub>S released per day

# Concentration of Hydrogen Sulfide in Air Sampled on the Berm of a Swine Lagoon

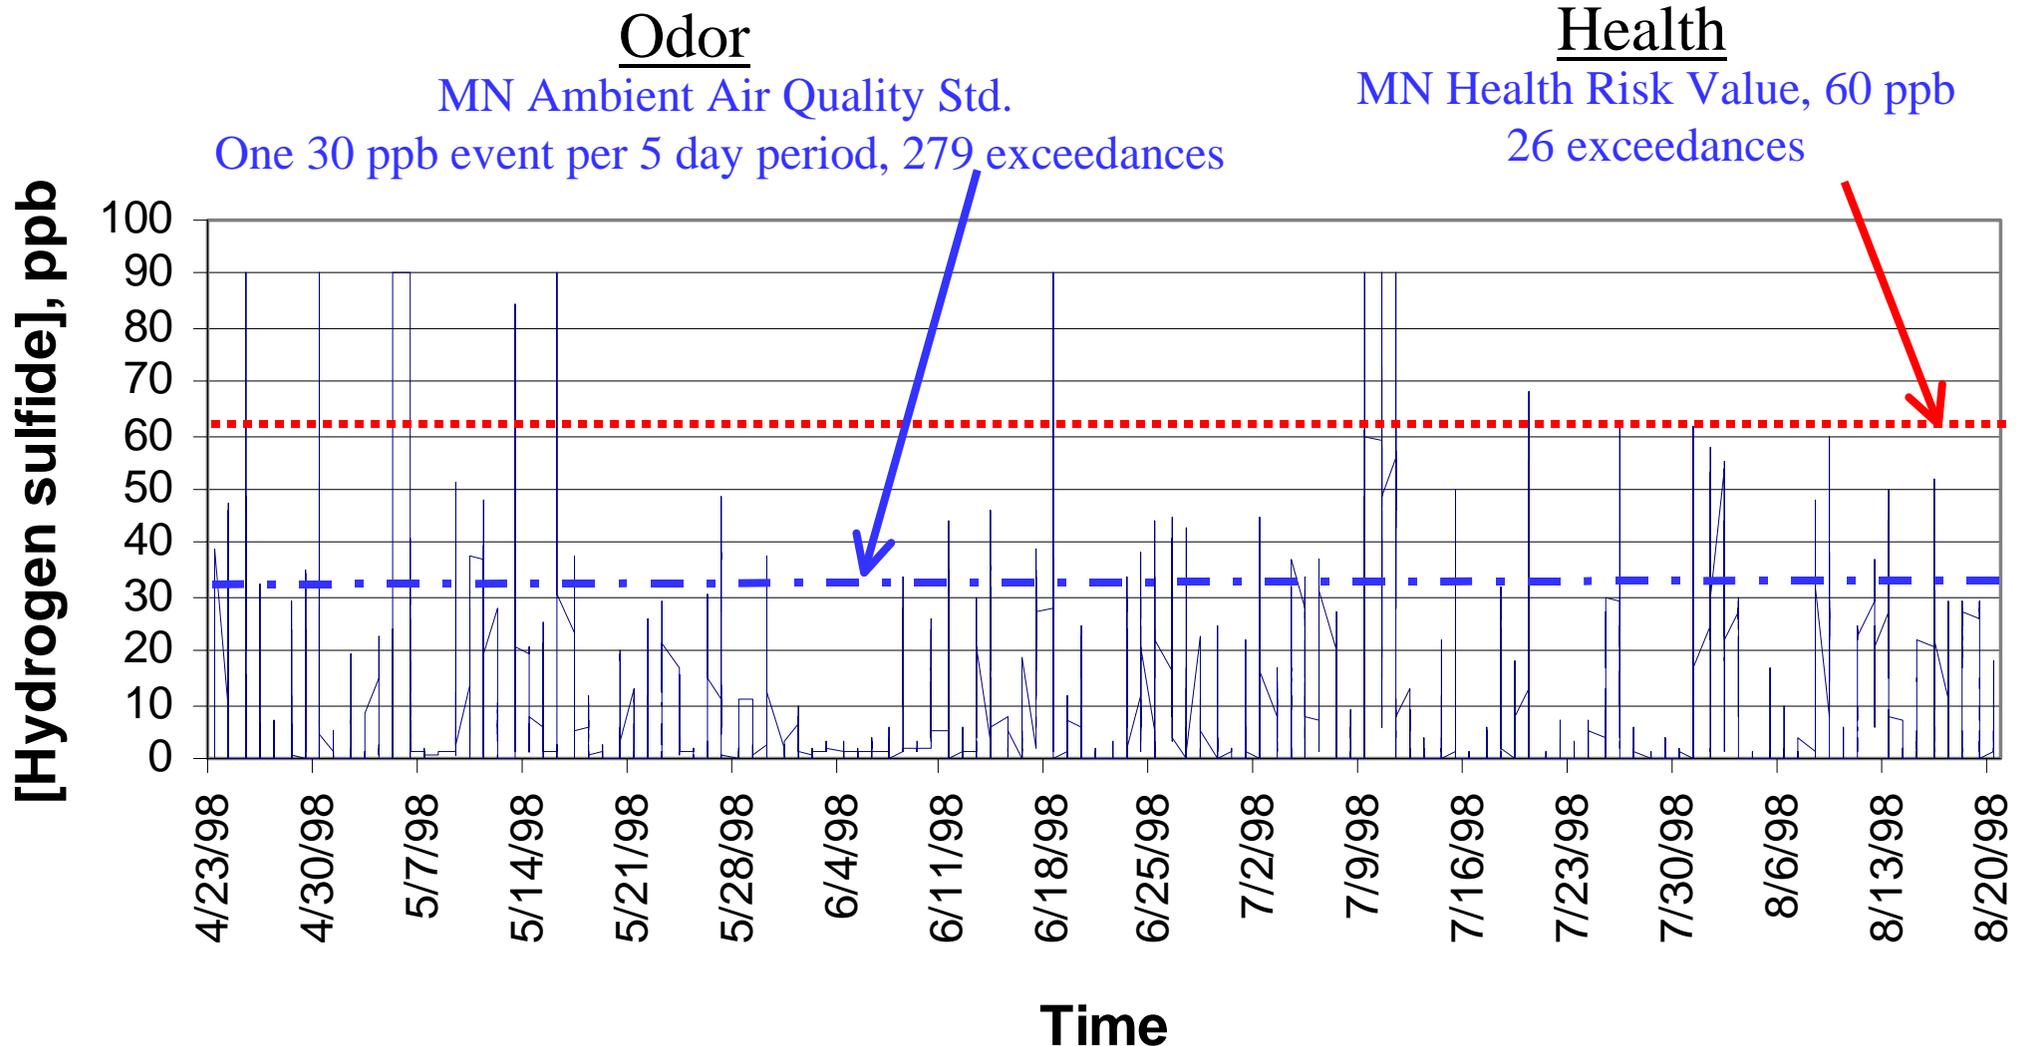

Summer 1999

Zahn et al., 2001

# Property Boundary [H<sub>2</sub>S] Adjacent to a Swine Production Facility

*MDA Scientific single point monitor; 0.5 hr ave.; detection range 0-90 ppb*

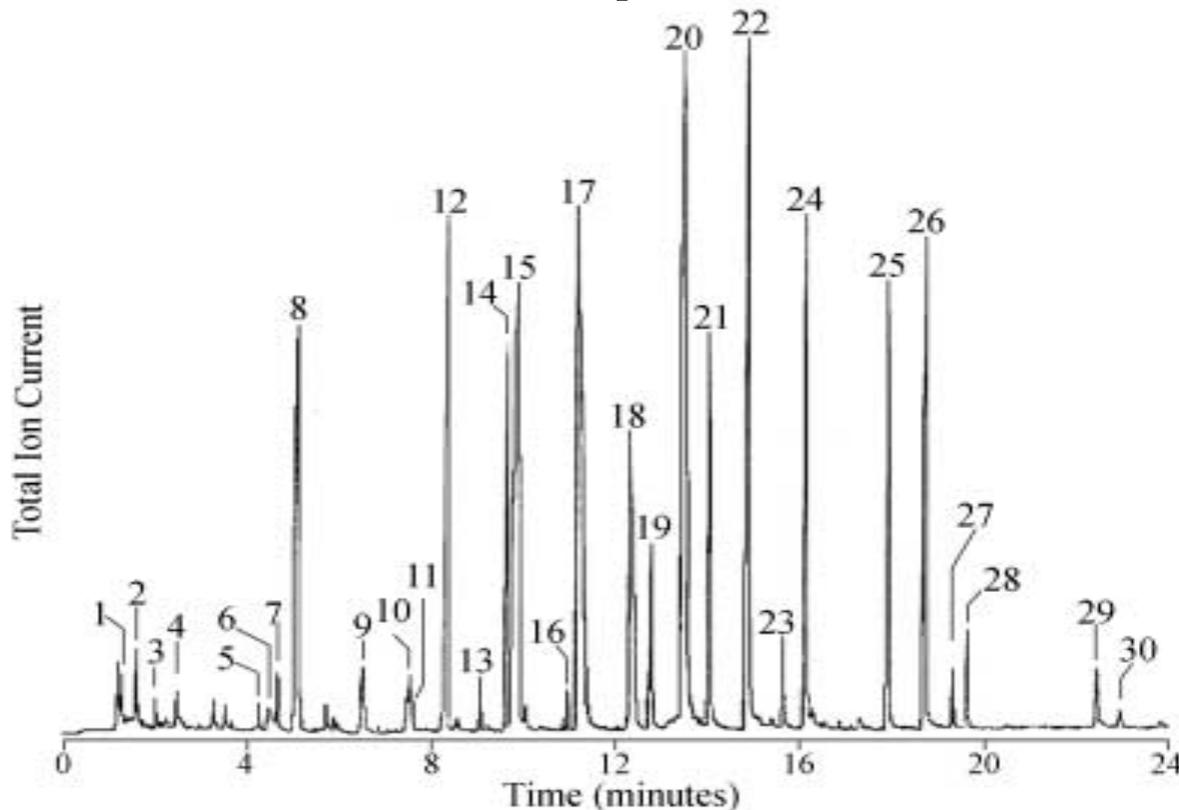

# Impact of CAFO Emissions on the Environment and Human Health

- Volatile Organic Compounds (VOC):
  - ◆ Generally vapor pres.  $\geq 0.1$  mm Hg, and mass  $\leq 140$  amu.
  - ◆ Best indicator of agricultural odor intensity.
  - ◆ Relatively low concentrations present in air ( $\leq 250 \mu\text{g} \cdot \text{m}^{-3}$ ).
  - ◆ Exceptional diversity (between 100 to 300 different cpds).
  - ◆ Priority pollutants: adverse impact on human health.
    - ◆ Benzene, chronic REL  $60 \mu\text{g} \cdot \text{m}^{-3}$  or 18 ppb; toluene, cresol, phenol, n-hexane, carbon disulfide, methanol (toxic substance list).
  - ◆ Reactive Organic Gas (U.S. EPA).
    - ◆ Participates in atmospheric photochemical reactions and formation of ozone in the lower atmosphere.

# Volatile Organic Compounds Emitted from a Swine Lagoon

GC-MS

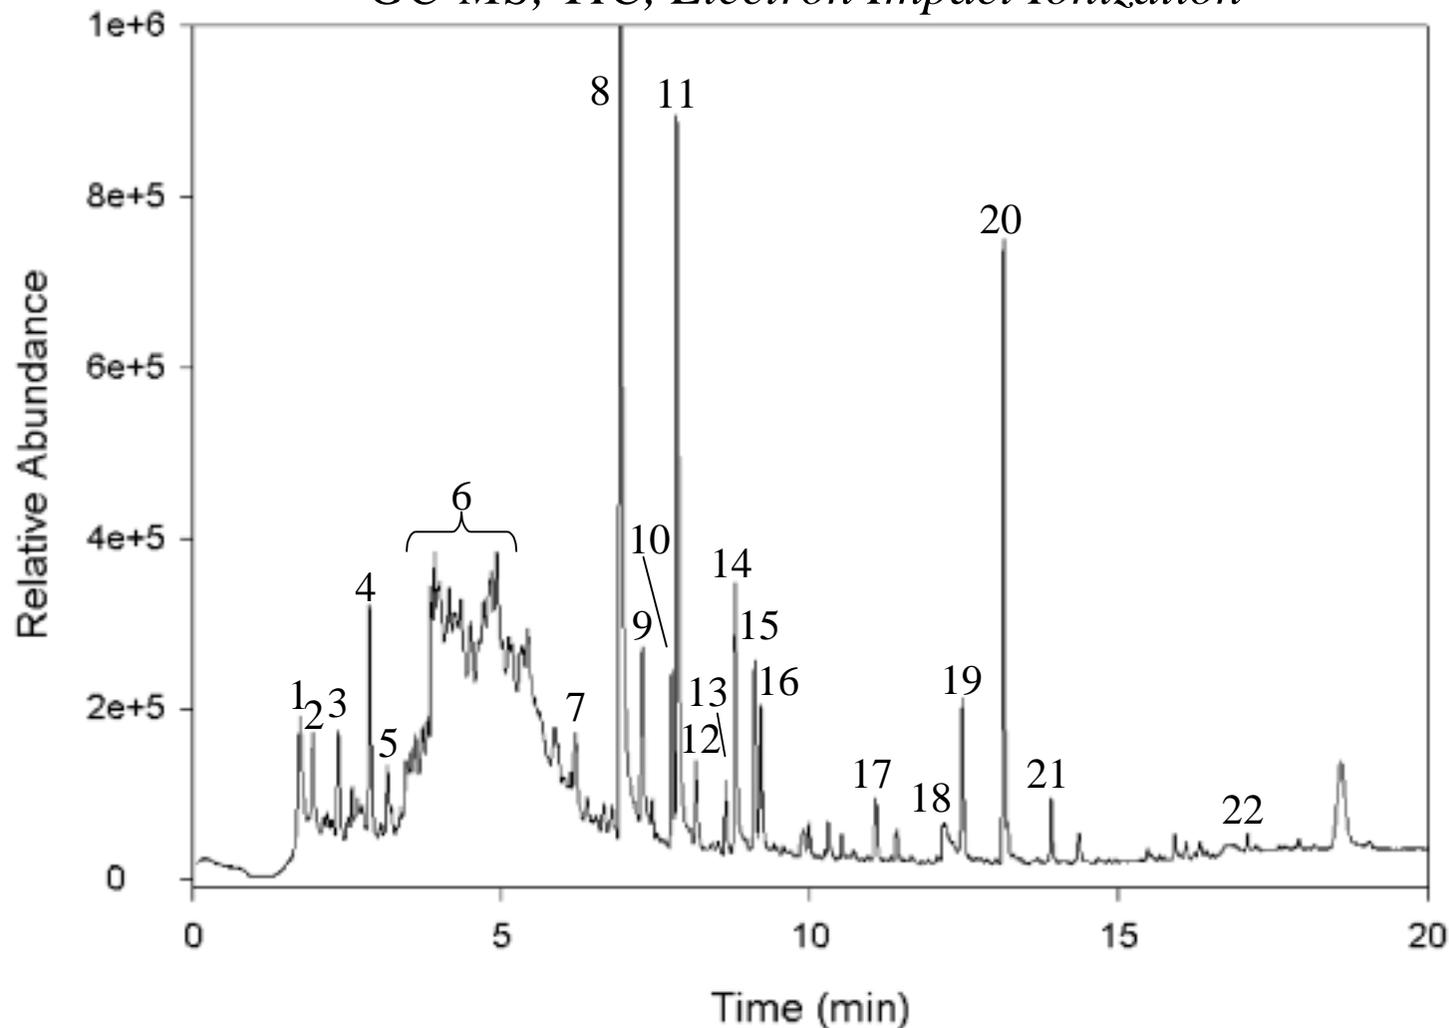

TIC, Electron Impact Ionization

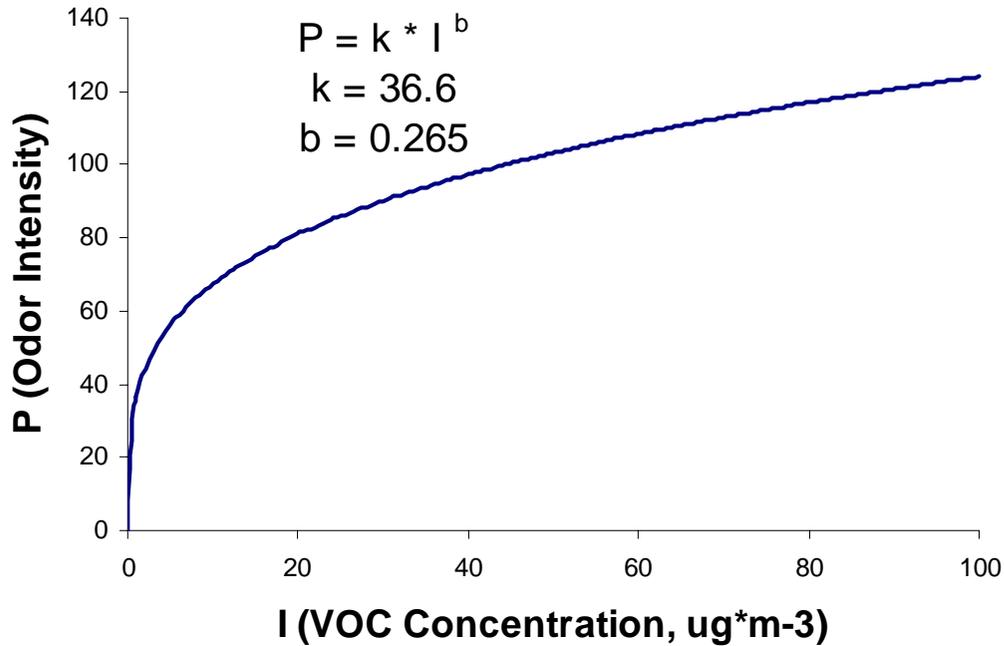

1. n-Hexane
2. Methane, thiobis
3. 1-Octene
4. Acetic acid, ethyl ester
5. 2-Butanol
6. Butanoic acid, ethyl ester
7. Ethanethioic acid, S-methyl ester
8. Dimethyl disulfide
9. 1-Butanol
10. 3-Methyl-1-butanol
11. 4-Methyl-2-pentanol
12. 1-Pentanol
13. 4-Methyl-1-pentanol
14. 1-Hexanol
15. Dimethyl trisulfide
16. 1-Heptanol
17. Acetic acid
18. Propanoic acid
19. 2-Methyl propanoic acid
20. Butanoic acid
21. 3-Methyl butanoic acid
22. Pentanoic acid
23. 4-Methyl Pentanoic acid
24. Hexanoic acid
25. Phenol
26. 4-Methyl phenol
27. 2-Peperidinone
28. 4-Ethyl phenol
29. Indole
30. 3-Methyl indole

# Volatile Organic Compounds Emitted from a Swine Confinement

*GC-MS; TIC, Electron Impact Ionization*

1. Piperazine
2. 2-Octanamine
3. Benzene
4. Toluene
5. Hexanal
6. Alkanaes
7. Nonanal
8. Acetic acid
9. 2-Ethyl-1-hexanol
10. Benzaldehyde
11. Propionic acid
12. Isobutyric acid
13. Benzonitrile
14. Butyric acid
15. 1-Phenyl ethanone
16. Isovaleric acid
17. 1-Methyl naphthalene
18. Hexamine
19. Phenol
20. p-Cresol
21. 4-Ethyl phenol
22. 3-Methyl indole

# [VOC] as a Indicator of Swine Odor Intensity

Zahn et al., 2001, J. Environ. Qual., 30:624-634

Mathematical model for swine odor intensity using measured concentration of nine VOC from ag site air samples

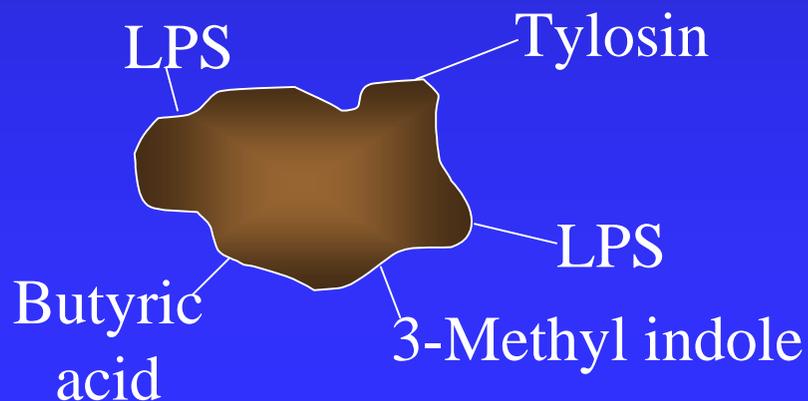

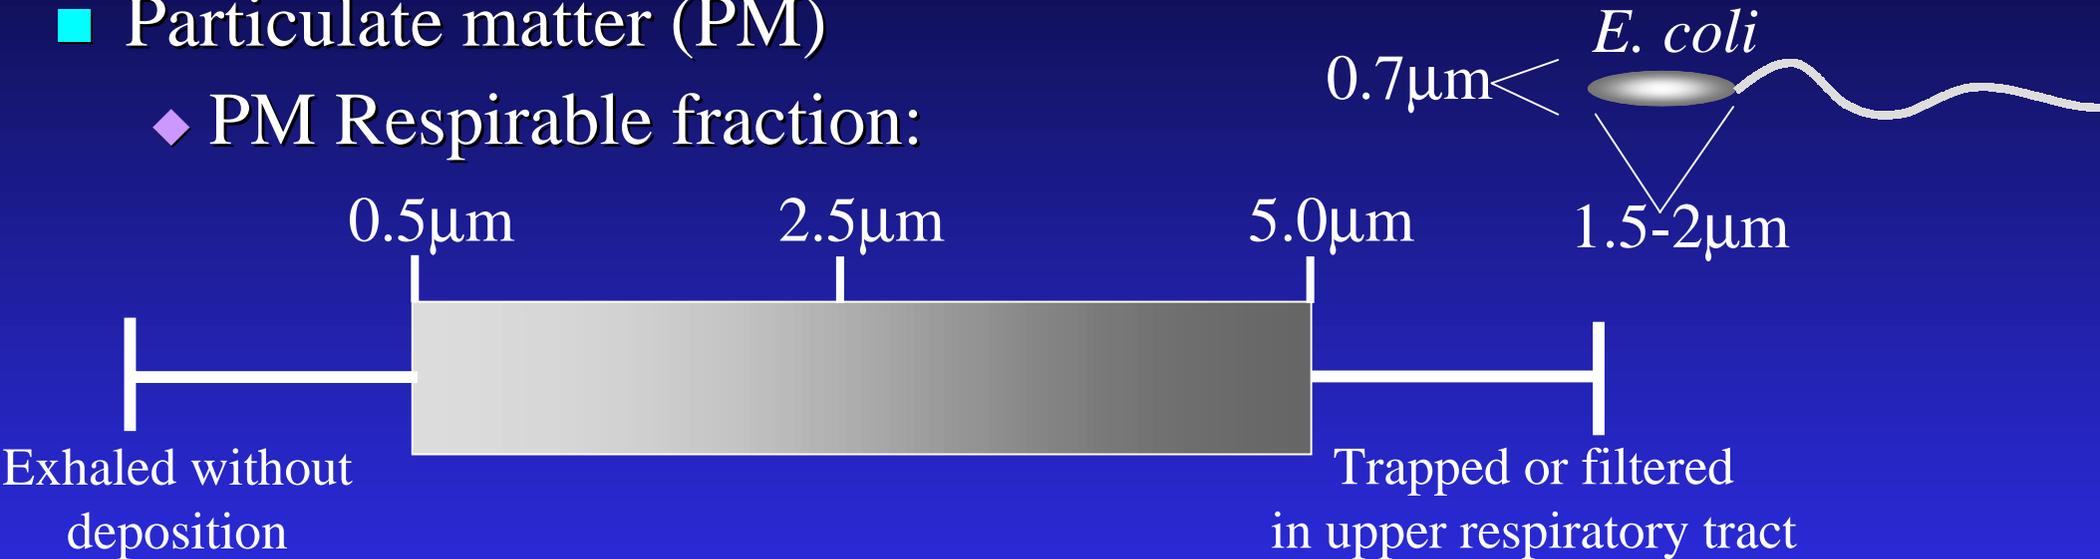

$$\begin{aligned}
 \text{Odor Intensity} = & 50.0 + (20.2(a/22.7)) + (5.5(b/34)) + \\
 & 47.3(c/10.7) + (7.8(d/21.0)) + (22.8(e/24.5)) + (3.5(f/146.0)) + \\
 & (3.9(g/14.2)) + (-116.5(h/11.2)) + (89.57(i/18.0))
 \end{aligned}$$

Where: a = valeric acid ( $\mu\text{g}\cdot\text{m}^{-3}$  in air), b = butyric acid ( $\mu\text{g}\cdot\text{m}^{-3}$  in air), c = heptanoic acid ( $\mu\text{g}\cdot\text{m}^{-3}$  in air), d = phenol ( $\mu\text{g}\cdot\text{m}^{-3}$  in air), e = 4-methyl phenol ( $\mu\text{g}\cdot\text{m}^{-3}$  in air), f = acetic acid ( $\mu\text{g}\cdot\text{m}^{-3}$  in air), g = isobutyric acid ( $\mu\text{g}\cdot\text{m}^{-3}$  in air), h = 4-ethyl phenol ( $\mu\text{g}\cdot\text{m}^{-3}$  in air), i = 3-methyl indole ( $\mu\text{g}\cdot\text{m}^{-3}$  in air).

# Impact of CAFO Emissions on the Environment and Human Health

## ■ Particulate matter (PM)

### ◆ PM Respirable fraction:

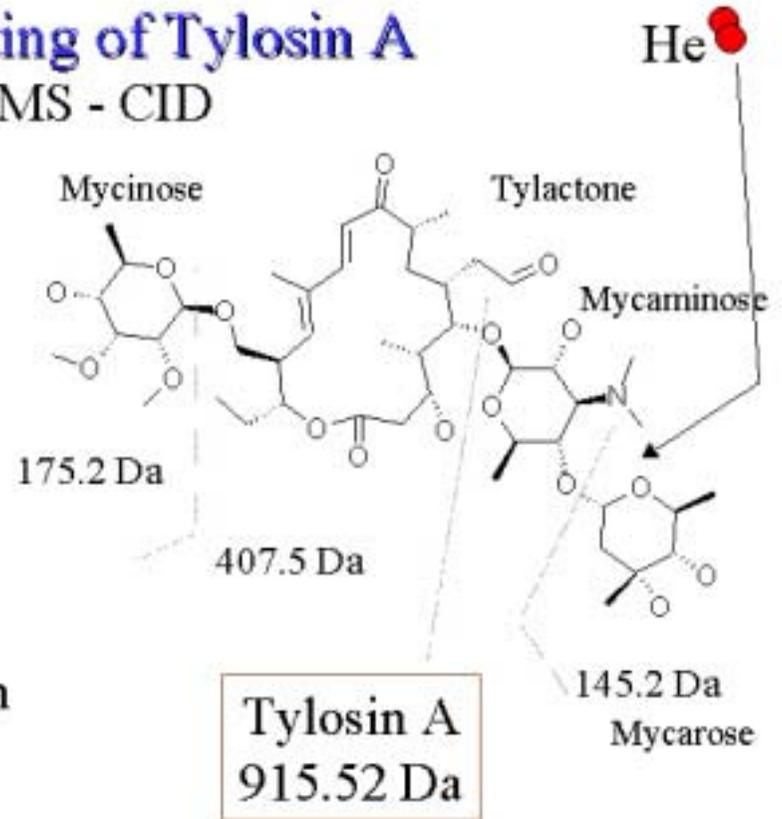

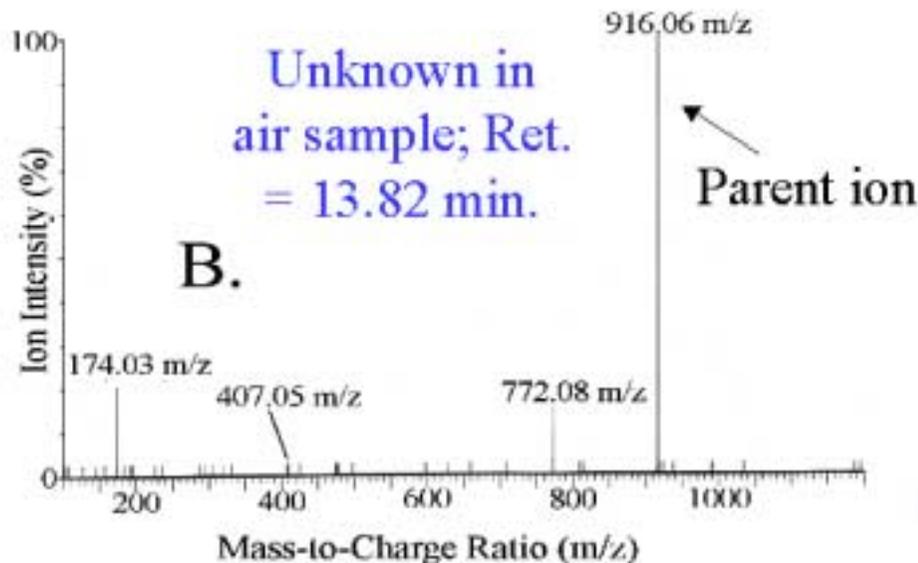

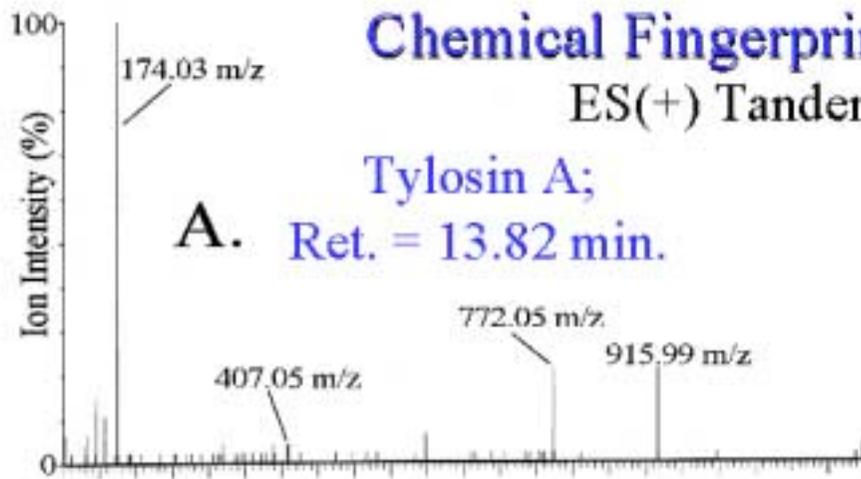

### PM as a carrier molecule:

- Bacteria & spores
- Endotoxins
- Antibiotics (from feed)
- Odorants (VOC)

# Impact of CAFO Emissions on the Environment and Human Health

- Non-Volatile Organic Compounds (particulate associated):
  - ◆ Vapor pres. < 0.003 mm Hg; and mass > 140 amu.
  - ◆ Particulate-borne compounds. Bioactive microbial secondary metabolites. Extremely active < 0.1 ppb.
  - ◆ Many are allergens or toxins, and some have been associated with ill symptoms of damp buildings.
  - ◆ Examples: Antibiotics, mycotoxins, G-lypopolysaccharide,  $\beta$ -D-glucans, valinomycin, kalafungin (cAMP kinase inhibitors).

# Identification of Tylosin in Air Emitted from Swine Barns using Tylan in Animal Feed as a Growth Promoter

Collision-induced dissociation  
Ion Trap MS (LCQ) or Quadrupole-  
(Orthogonal) Time-of-Flight MS (Q-TOF)

# Conclusions

- Air pollutants from CAFO have the potential to adversely impact human health – onsite and offsite.
  - ◆ Considerable diversity exists among States in ambient air quality standards and ability to enforce laws.
- Hydrogen sulfide has been determined to cause off-site health risks to CAFO neighbors (MN):
  - ◆ low acute HRV (42 to 80  $\mu\text{g}\cdot\text{m}^{-3}$ ).
  - ◆  $\text{H}_2\text{S}$  is the major sulfur cpd. from CAFOs (>95% of total S).
- Air pollutants from CAFOs can cause environmental damage/change – E.U. legislation  $\text{NH}_3$ :
  - ◆ Zahn et al., 2001 – CAFO emissions exceed EPA CERCLA regs.
  - ◆ Acidification (shifts from native diverse plant communities)
  - ◆ Eutrophication (freshwater fouling and toxic blooms)
  - ◆ Global warming ( $\text{CH}_4$ ,  $\text{N}_2\text{O}$ , and VOC)
